GROWING TIPS

Ready for the best grow of your life?

The first step is to preprare the pot where you will plant the seed with **Light·Rebel or Coco·Kaya.**

When the little plant is about 15 days old and shows real leaves, it is time to start fertilizing. That moment corresponds to Week 2 of our PLAN.

Watering every day? No need to! Every 2-3 days is enough, always with nutrients and mixing all products in the same watering recipient.

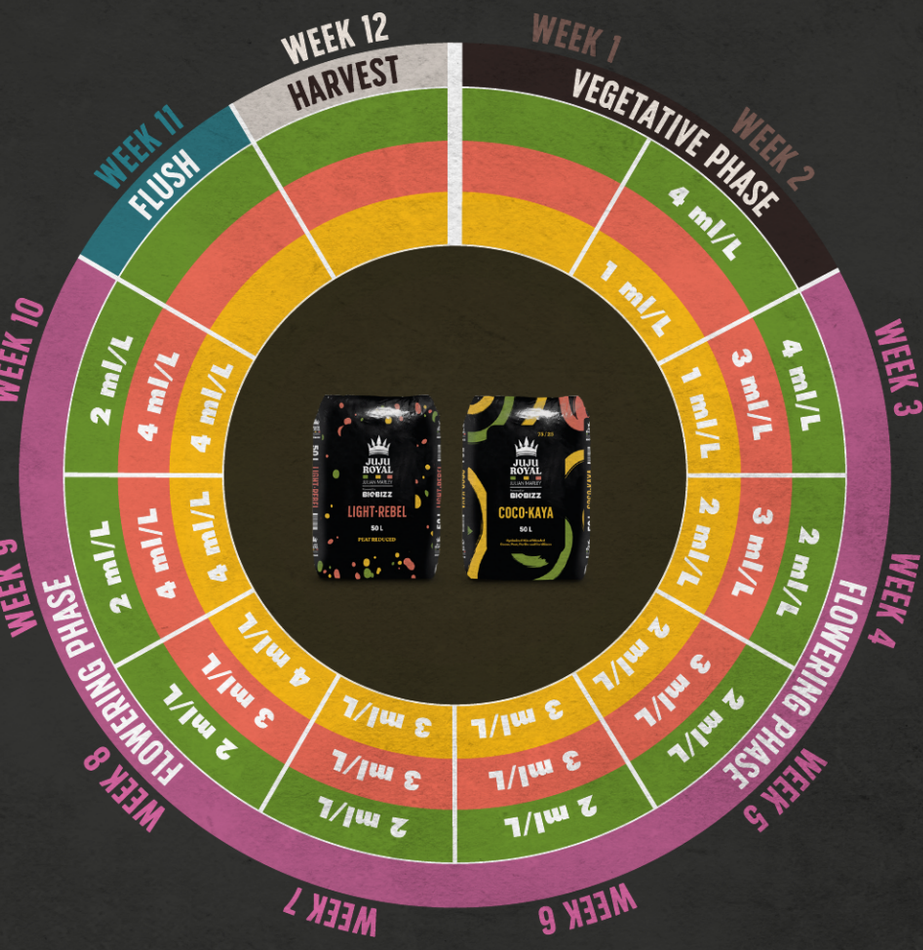

There is no need to go to town with water or nutrients. It is much better to fall short than to overwater or overfeed.

The ideal pH would be between 6.2-6.5. Remeber to always adjust the pH with organic regulators!

In case of very soft or RO water, you can add a 100% organic Ca/Mg supplement.

Want to make the most of Green·Mystic? Use 1-2 ml/L as a foliar spray once a week, preventing the flowers from getting wet, and you'll see your plants' best version.
